

## Reflect on Javascript

The time I spent this past week on FreeCodeCamp was not my first time with Javascript. During the summer of 2013 I used CodeAcademy to learn HTML, CSS, and Javascript so I could build a website for my school's robotics team. I never built the site, though I finished the lessons. More recently I took ICS 215, Introduction to Scripting, last semester at Leeward Community College where I was introduced to the basics of Perl, and Python, and reacquainted with Javascript. In regards to Javascript and this module I didn't learned anything new.

As a tool for a web developer, I think Javascript is a good programming language. It allows websites to be more dynamic and unique while being easy to learn and rigidly flexible in its structure.. Beyond its web capabilities I don't see how Javascript can be used. So it's good for what it does and outside of that it just is.

I find the practice WODs humbling and frustrating. Receiving a DNF on the first real WOD reiterated an old nemesis of mine, failure, or rather the fear of it. I realized how much I hated that feeling, especially when I began so confident in my knowledge of Javascript and understanding of the task. Since then I have come to see that while WODs are stressful, they push me to be more diligent and thorough when preparing for the coming week and the coming WOD. In time, I think I can make WODs work for me.
